# Example 13-2

Isao Sasano

2016 July 5

**Example**

(1) Calculate the Fourier series $f(x) = x$ on the range $[-L, L]$ in the form of

$$\frac{1}{2}a_0 + \sum_{k=1}^{\infty}\{a_k \cos\omega_k x + b_k \sin\omega_k x\}$$

where $\omega_k = \dfrac{k\pi}{L}$.

(2) Calculate the Fourier series $f(x) = x$ on the range $[-L, L]$ in the form of

$$\sum_{k=-\infty}^{\infty} c_k e^{i\omega_k x}$$

where $\omega_k = \dfrac{k\pi}{L}$.

**Solution**

(1) Assume the following equation holds. (Note that there are no coefficients $a_0$, …, $a_n$ that satisfy the equation, but it's ok.)

$$f(x) = \frac{1}{2}a_0 + \sum_{k=1}^{n}\{a_k \cos\omega_k x + b_k \sin\omega_k x\}$$

Firstly integrate the both sides on $[-L, L]$.

$$\begin{aligned}\int_{-L}^{L} f(x)\mathrm{d}x &= \int_{-L}^{L} \frac{1}{2}a_0\mathrm{d}x \\ &= La_0\end{aligned}$$

So we obtain $a_0$ as follows.

$$\begin{aligned} a_0 &= \frac{1}{L}\int_{-L}^{L} f(x)\mathrm{d}x \\ &= \frac{1}{L}\int_{-L}^{L} x\mathrm{d}x \\ &= 0 \end{aligned}$$

Secondly we multiply the both sides by $\cos\omega_k x$ and integrate them on the range $[-L, L]$.

$$\begin{aligned} \int_{-L}^{L} f(x)\cos\omega_k x\mathrm{d}x &= \int_{-L}^{L} a_k\cos^2\omega_k x\mathrm{d}x \\ &= La_k \end{aligned}$$

So we calculate $a_k$ as follows.

$$\begin{aligned} a_k &= \frac{1}{L}\int_{-L}^{L} f(x)\cos\omega_k x\mathrm{d}x \\ &= \frac{1}{L}\int_{-L}^{L} x\cos\omega_k x\mathrm{d}x \\ &= 0 \end{aligned}$$

Thirdly we multiply the both sides by $\sin\omega_k x$ and integrate them on the range $[-L, L]$.

$$\begin{aligned} \int_{-L}^{L} f(x)\sin\omega_k x\mathrm{d}x &= \int_{-L}^{L} b_k\sin^2\omega_k x\mathrm{d}x \\ &= Lb_k \end{aligned}$$

So we calculate $b_k$ as follows.

$$\begin{aligned} b_k &= \frac{1}{L}\int_{-L}^{L} f(x)\sin\omega_k x \mathrm{d}x \\ &= \frac{1}{L}\int_{-L}^{L} x\sin\omega_k x \mathrm{d}x \\ &= \frac{1}{L}\left\{\left[x\frac{-\cos\omega_k x}{\omega_k}\right]_{-L}^{L} - \int_{-L}^{L}\frac{-\cos\omega_k x}{\omega_k}\mathrm{d}x\right\} \\ &= \frac{1}{L}\left\{L\cdot\frac{-\cos k\pi}{\omega_k} - (-L)\cdot\frac{-\cos(-k\pi)}{\omega_k}\right\} \\ &= \frac{1}{L}\left\{L\cdot\frac{-\cos k\pi}{\omega_k} + L\cdot\frac{-\cos k\pi}{\omega_k}\right\} \\ &= -\frac{2\cos k\pi}{\omega_k} \\ &= -\frac{2}{\omega_k}(-1)^k \end{aligned}$$

So the following is the linear combination closest to the function $f(x) = x$.

$$\sum_{k=1}^{n}\{-\frac{2}{\omega_k}(-1)^k\sin\omega_k x\}$$

The Fourier series is the limit of the linear combination as $n$ goes to infinity.

$$\sum_{k=1}^{\infty}\{-\frac{2}{\omega_k}(-1)^k\sin\omega_k x\}$$

We depict the partial summation of this series up to the term of $\cos\omega_{10}x$ and $f(x) = x$ when $L = 1.0$ in Fig. 1.

(2) Assume the following equation holds. (Note that there are no coefficients $c_{-n}$, ..., $c_0$, ..., $c_n$ that satisfy the equation, but it's ok.)

$$f(x) = \sum_{l=-n}^{n} c_l e^{i\omega_l x}$$

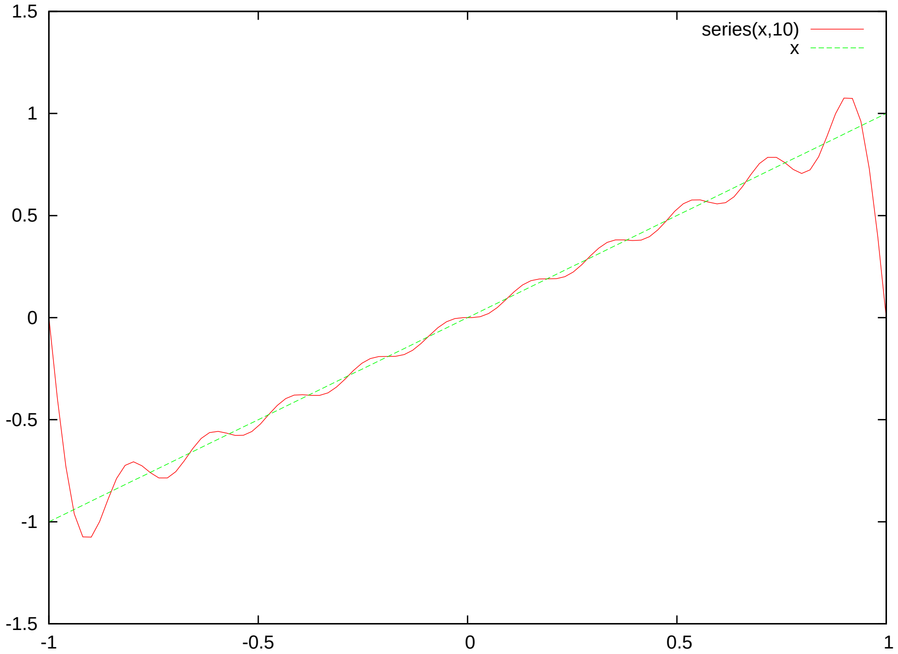

Figure 1: Comparison between the function $f(x) = x$ and the partial sum up to the term of $\cos \omega_{10} x$

Multiply the both sides of this equation by $e^{-i\omega_k x}$ and integrate them on the range $[-L, L]$.

$$
\begin{aligned}
\int_{-L}^{L} f(x)e^{-i\omega_k x}\mathrm{d}x &= \int_{-L}^{L} e^{-i\omega_k x}\sum_{l=-n}^{n} c_l e^{i\omega_l x}\mathrm{d}x \\
&= \int_{-L}^{L} \sum_{l=-n}^{n} c_l e^{i\omega_l x}e^{-i\omega_k x}\mathrm{d}x \\
&= \int_{-L}^{L} \sum_{l=-n}^{n} c_l e^{i(\omega_l-\omega_k)x}\mathrm{d}x \\
&= \int_{-L}^{L} \sum_{l=-n}^{n} c_l e^{i\omega_{l-k}x}\mathrm{d}x \\
&\qquad \text{(since } \omega_l - \omega_k = \frac{l\pi}{L} - \frac{k\pi}{L} = \frac{(l-k)\pi}{L}\text{)} \\
&= \sum_{l=-n}^{n} \int_{-L}^{L} c_l e^{i\omega_{l-k}x}\mathrm{d}x \\
&= \int_{-L}^{L} c_k e^{0}\mathrm{d}x \\
&= \int_{-L}^{L} c_k \mathrm{d}x \\
&= 2Lc_k
\end{aligned}
$$

So we obtain $c_k$ as follows.

$$
c_k = \frac{1}{2L}\int_{-L}^{L} f(x)e^{-i\omega_k x}\mathrm{d}x
$$

When $k \neq 0$ we calculate $c_k$ as follows.

$$\begin{aligned}
c_k &= \frac{1}{2L}\int_{-L}^{L} f(x)e^{-i\omega_k x}\mathrm{d}x \\
&= \frac{1}{2L}\int_{-L}^{L} xe^{-i\omega_k x}\mathrm{d}x \\
&= \frac{1}{2L}\left\{\left[x\frac{e^{-i\omega_k x}}{-i\omega_k}\right]_{-L}^{L} - \int_{-L}^{L}\frac{e^{-i\omega_k x}}{-i\omega_k}\mathrm{d}x\right\} \\
&= \frac{1}{2L}\cdot\frac{Le^{-i\omega_k L}-(-L)e^{i\omega_k L}}{-i\omega_k} \qquad \left(\text{since } \int_{-L}^{L} e^{-i\omega_k x}\mathrm{d}x = 0\right) \\
&= \frac{1}{2L}\cdot\frac{Le^{-i\frac{k\pi}{L}L}-(-L)e^{i\frac{k\pi}{L}L}}{-i\omega_k} \\
&= \frac{1}{2L}\cdot\frac{Le^{-ik\pi}-(-L)e^{ik\pi}}{-i\omega_k} \\
&= \frac{1}{2L}\cdot\frac{L(-1)^k+L(-1)^k}{-i\omega_k} \\
&= \frac{1}{2L}\cdot\frac{2L(-1)^k}{-i\omega_k} \\
&= \frac{(-1)^k}{-i\omega_k} \\
&= \frac{1}{\omega_k}(-1)^k i
\end{aligned}$$

When $k = 0$ we calculate $c_0$ as follows.

$$\begin{aligned}
c_0 &= \frac{1}{2L}\int_{-L}^{L} x\mathrm{d}x \\
&= 0
\end{aligned}$$

So we obtain the series

$$\sum_{k=-n}^{n} c_k e^{ikx}$$

where

$$c_k = \begin{cases} \frac{1}{\omega_k}(-1)^k i & k \neq 0 \\ 0 & k = 0. \end{cases}$$

The Fourier series is the limit of the above linear combination as $n$ goes to infinity.

$$\lim_{n\to\infty} \sum_{k=-n}^{n} c_k e^{ikx} = \sum_{k=-\infty}^{\infty} c_k e^{ikx}$$
